Classical Mechanics & Newton's Laws of Motion

Foundational mechanics notes covering inertial reference frames, Newton's three laws, momentum conservation, and Lagrangian formulations.

---

1. Inertial Frames & Newton's Laws

First Law defines inertial frames. Second Law F = dp/dt establishes equations of motion. Third Law asserts equal and opposite forces.

2. Conservation Principles & Energy

Linear and angular momentum conservation in isolated systems, work-energy theorem, and conservative potential fields.
